

M.: Ready-made food supplements: Oral (ONS)

Same as manually prepared food supplement, this ready-made food supplement of different variety is for patients who does not have the ability to feed by oral.

M.1: Definition

Oral Nutritional Supplements (ONS) are sterile liquids, semi-solids or powders, which provide macro and micronutrients. requirements through oral diet alone
They are widely used within the acute and community health settings for individuals who are unable to meet their nutritional

M.2 Indications for use include:

Short bowel syndrome · Intractable malabsorption· Intractable malabsorption · Intractable malabsorption· Bowel fistulae· Dysphagia ·Total gastrectomy

Inflammatory bowel disease Disease related malnutrition (chronic/acute) Disease related malnutrition (chronic/acute)

Disease related malnutrition (chronic/acute) Disease related malnutrition (chronic/acute)

ONS may be prescribed in the short term during acute illness, but also for individuals with long term chronic conditions

The role of ONS is to complement nutritional intake, and simultaneous information around improving oral intake should be provided

Some ONS are available to buy over the counter in supermarkets or pharmacies (usually in powder form which are mixed with milk or water)

but the majority of ONS are only available on prescription ideally following advice from a registered dietitian.

take into account nutritional requirements and taste and texture preferences to ensure a tailored prescription is advised.

ONS often contain macronutrients (protein and/or energy) and micronutrients (vitamins and minerals) at varying levels of concentrations

Therefore, not all ONS are nutritionally complete, meaning that they cannot be used as a sole source of nutrition

Individual dietetic assessment will take into account nutritional requirements and taste and texture preferences to ensure a tailored prescription is advised

M.3: NOTE

Further information regarding suitability of ONS should be checked with individual manufacturers for example, gluten or lactose free, halal or kosher.

ONS should be used with caution in those with dysphagia to ensure the correct consistency is provided. Thickeners can be added to obtain the recommended consistency.

A range of flavors should be offered to avoid taste fatigue.

There is an emerging group of ONS which are designed for individuals over the age of 65 years who can be at risk of vitamin D deficiency.

Other products may be useful in patients with specific medical conditions where fluid and electrolyte balance are important.

Patients with short gut may not tolerate hyperosmolar ONS as they may increase stoma losses.

M.4: Monitoring

ONS should not be prescribed without being monitored to ensure that they remain appropriate and are being taken as prescribed. ONS may be stopped when:

Dietary intake is meeting nutritional requirements.

Weight has increased to target.

BMI is within healthy range.

The individual's medical condition has changed, e.g. an individual with a swallowing difficulty recovers some/all their functionality.

The individual can no longer tolerate them due to taste fatigue.

M.5: Some products are available in the nutrition department :
